

Hello, my name is [insert name here]. you guys are mean sometimes. can god (who cannot lie) say that he is not god (since he is all powerfull).

Pluss there is no such thing as the set of all truth, this means that god cannot be omniscient.

its like this: every set of truths has a one to one identity with a single truth (this truth will now be know as the representative of that set). the truth A that will be the representative of any set X will be one of the next two propositions whichever is true.

A is in set X  
or  
A is not in set X

A representitive will be called "fucking cool" it is is not in the set that it represents. Now here question the proves god is not as cool ast the 9th beer that I am drinking: of the set of representitives that are fucking cool, is the representitive of that set fucking cool or not?

I just blew your mind didn't you?

what
